

# Pollution Plume Data Visualization

- What patterns do you notice in the data?
- What might be happening in the aquifer that could explain the patterns you notice in your visualizations?
- If you were an environmental scientist in charge of monitoring the groundwater for the community members that use the water, what would you do with this data?
- Compare this data visualization with the line graphs you created. What is the value of having both visualizations? In your opinion, which data visualization would be most effective at sharing the data to the general public?
